

Video inserter

RL4-MIB88

Compatible with

Audi vehicles

with MMI Radio Plus and MMI Navigation (Plus) infotainment
8.8inch, 10.1inch and 11.6inch monitor

examples

**Video-inserter for front- and rear-view camera
and two more video inputs**

Product features

- Video-inserter for factory-infotainment systems
- 1 CVBS Input for rear-view camera
- 1 CVBS Input for front camera
- 2 CVBS Video-inputs for after-market Video sources (e.g. USB-Player, DVB-T Tuner)
- Automatic switching to rear-view camera input on engagement of the reverse gear (not available for all vehicles)
- Automatic front camera switching after reverse gear for 10 seconds (not available for all vehicles)
- Activatable parking guide lines for rear-view camera (not available for all vehicles)
- Activatable PDC (not available for all vehicles)
- Video-in-motion (ONLY for connected video-sources)
- Video-inputs NTSC compatible

Contents

1. Prior to installation

6. Technical support

Legal Information

By law, watching moving pictures while driving is prohibited, the driver must not be distracted. We do not accept any liability for material damage or personal injury resulting, directly or indirectly, from installation or operation of this product. Apart from using this product in an unmoved vehicle, it should only be used to display fixed menus or rear-view-camera video when the vehicle is moving (for example the MP3 menu for DVD upgrades).

Changes/updates of the vehicle's software can cause malfunctions of the interface. Up to one year after purchase we offer free software-updates for our interfaces. To receive a free update, the interface has to be sent in at own cost. Wages for de-and reinstallation and other expenditures involved with the software-updates will not be refunded.

1. Prior to installation

Read the manual prior to installation. Technical knowledge is necessary for installation. The video interface's place of installation must be free of moisture and away from heat sources.

Before the final installation in the vehicle of the video sources, we recommend a test-run to ensure the compatibility of vehicle and interface. Due to changes in the production of the vehicle manufacturer there's always a possibility of incompatibility.

1.1. Delivery contents

Take down the serial number of the interface and store this manual for support purposes: _____

1.2. Checking the compatibility of vehicle and accessories

Requirements

Brand	Compatible vehicles	Compatible systems
Audi	A1 (GB) since 11/2018 A3 (8Y) since 03/2020 A4 Facelift (8W) since 05/2019 A5 Facelift (F5) since 10/2019 A6 (4K) since 06/2018 A7 (4K) since 02/2018 A8 (4N-D5) since 11/2017 e-tron (GE) since 03/2019 Q3 (F3) since 08/2018 Q4 e-tron (FZ) since 03/2021 Q4 Sportback e-tron (FZ) since 03/2021 Q5 (FY) since 09/2020 Q5 Sportback (FYT) since 03/2021 Q7 Facelift (4M) since 09/2019 Q8 (4M) since 07/2018	MMI Radio Plus or MMI Navigation or MMI Navigation (Plus) with MMI Touch Response MIB2+ High/ MIB3 Premium with 8.8inch, 10.1inch or 11.6inch monitor <i>Not compatible to vehicles with factory DVD-player (factory DVD does not show video anymore)!</i>

Limitations

<i>Video only</i>	The interface inserts ONLY video signals into the infotainment. For inserting Audio signals either the possibly existing factory audio-AUX-input or a FM-modulator can be used. If 2 audio sources shall be connected to the infotainment, an additional electronic is necessary to switch them.
<i>Factory rear-view camera</i>	Automatically switching-back from inserted video to factory rear-view camera is only possible while the reverse gear is engaged. To delay the switch-back an additional electronic part is required.
<i>Factory DVD-player</i>	Not compatible to vehicles with factory DVD-player (factory DVD does not show video anymore)!
<i>After market front camera</i>	The front camera will automatically be switched for 10 seconds after disengaging the reverse gear. A manually front camera switching is possible by external keypad.
<i>Guidelines and PDC</i>	Displayed guidelines and optical PDC are not available in all vehicles.
<i>Video input signal</i>	NTSC video sources compatible only.

1.3. Boxes and connectors – video interface

The video-interface converts the video signals of connected after-market sources in a factory monitor compatible picture signal which is inserted in the factory monitor, by using separate trigger options. Further it reads the vehicle's digital signals out of the vehicle's CAN-bus and converts them for the video interface.

1.4. Settings - 8 Dip switches (black)

Some settings have to be selected by the dipswitches on the video interface. Dip position down is ON and position up is OFF.

Dip	Function	ON (down)	OFF (up)
1	Front camera	enabled*	disabled
	Power supply output (red wire)	+12V (max. 3A) when reverse gear is engaged incl. 10 seconds delay and +12V by manual switching to front camera by keypad	+12V (max. 3A) ACC
2	Video 1-input	enabled	disabled
3	Video 2-input	enabled	disabled
4	No function		set to OFF
5	Rear-view cam type	after-market	factory or none
6	Guide-lines	enabled	disabled
7	Monitor type	Try both possible dip settings of dip7 to find the best picture (quality and size)	
8	PDC	enabled	disabled

After each Dip-switch-change a power-reset of the Video interface has to be performed!

*The front camera will automatically be switched for 10 seconds after disengaging the reverse gear.

See the following chapters for detailed information.

1.4.1. Activating the front camera (dip 1)

If set to ON, the interface switches for 10 seconds from the rear-view camera to the front camera input after having disengaged the reverse gear. In addition, a manual switch-over to the front camera input is possible via keypad (short press) from any image mode.

Description of the power supply output: see chapter "Power supply output".

1.4.2. Enabling the interface's video inputs (dip 2-3)

Only the enabled video inputs can be accessed by switching through the interface's video sources. It is recommended to enable only the required inputs. So the disabled inputs will be skipped while switching through the video interfaces inputs.

Note: Dip 4 is out of function and have to be set to **OFF**!

1.4.3. Rear-view camera setting (dip 5)

If set to OFF, the interface switches to factory picture while the reverse gear is engaged to display factory rear-view camera or factory optical park system picture.

If set to ON, the interface switches to its rear-view camera input while the reverse gear is engaged.

1.4.4. Activating the guide lines (dip6)

If set to ON, the guide lines will be shown on the display.

If set to OFF, the guide lines won't be visible on the display.

Note: If there is no communication between interface and the vehicle's CAN-bus (several vehicles aren't compatible), the reverse gear guide-lines can't be shown during the vehicle's operation, even if they once appear after having switched the system to powerless!

1.4.5. Monitor type (dip 7)

Dips 7 is for monitor-specific video settings which cannot be predicted as even within the same head-unit version, the monitor specifications may vary. It is necessary to try both possible settings - while a working video source is connected to the chosen input of the interface - to see which setting gives the best picture quality and size. It is possible to first hot plug through the dip settings, but if you do not experience any change of picture after trying, retry and disconnected the 10pin power plug of the video-box between every change of the dip setting.

1.4.6. Activation of the PDC Graphic (dip 8)

If set to ON, the PDC graphic is displayed as „picture in picture“ in combination with the camera image.

Note: If the video interface does not receive the required information from the vehicle CAN-bus, the optical PDC display cannot be supported.

After each Dip-switch-change a power-reset of the Interface-box has to be performed!

1.5. Settings of the 4 Dip switches (CAN functions – red)

The 4 dip-switches of the video are used to select the kind and choice of the factory head-unit.

Dip position down is ON and position up is OFF.

Dip	Funktion	ON (unten)	OFF (oben)
1	Mauual selection of the Head Unit System (only possible if dip2= OFF)	Harman	Alpine, Aptiv/Delphi
2	Automatic recognition of the head unit system	enabled	disabled (with manual selection of the Head Unit via dip 1)
3	No function		Auf OFF stellen
4	No function		Auf OFF stellen

After each Dip-switch-change a power-reset of the video interface has to be performed!

1.6. Settings of the 2 Dip switches (selection head unit - black)

The 2 dip switches on the upper side of the interface box are used to select the head unit.

Warning! Dip position up is ON and position down is OFF (vice versa to the black 8 dips and the red 2 dips).

Manufacturer head unit	Dip 1	Dip 2
Alpine, Aptiv/Delphi	OFF ↓	OFF ↓
Harman	ON ↑	ON ↑

After each Dip-switch-change a power-reset of the video interface has to be performed!

2. Installation

To install the interface, first switch off the ignition and disconnect the vehicle's battery. Please read the owner's manual of the car, regarding the battery's disconnection! If required, enable the car's Sleep-mode (hibernation mode)
In case the sleep-mode does not succeed, the disconnection of the battery can be done with a resistor lead.

As with any installation of retrofit equipment, a stand-by test is necessary after the installation of the video interface, to ensure that the unit also switches off after reaching the vehicle's sleep mode.

Before the final installation, we recommend a test-run of the interface. Due to changes in the production of the vehicle manufacturer, there's always the possibility of incompatibility.

2.1. Place of installation

The interface is supposed to be installed at a suitable location behind the vehicle's head-unit.

Model	Location of the Head Unit
A6	at the top behind glove box
A8	behind the glove box
e-tron	centre console under the ventilation for the rear passengers*.

***Note:** In the e-tron, the following hidden screw (Torx) must be loosened at the rear of the centre console (one screw, the rest is inserted - ventilation doesn't have to be removed).

2.2. Note for test run

In vehicles in which the climate control system is operated by the touchscreen monitor, it is necessary to have the monitor connected for an interface test run.

2.3. Connection schema

2.4. Connection - factory head-unit

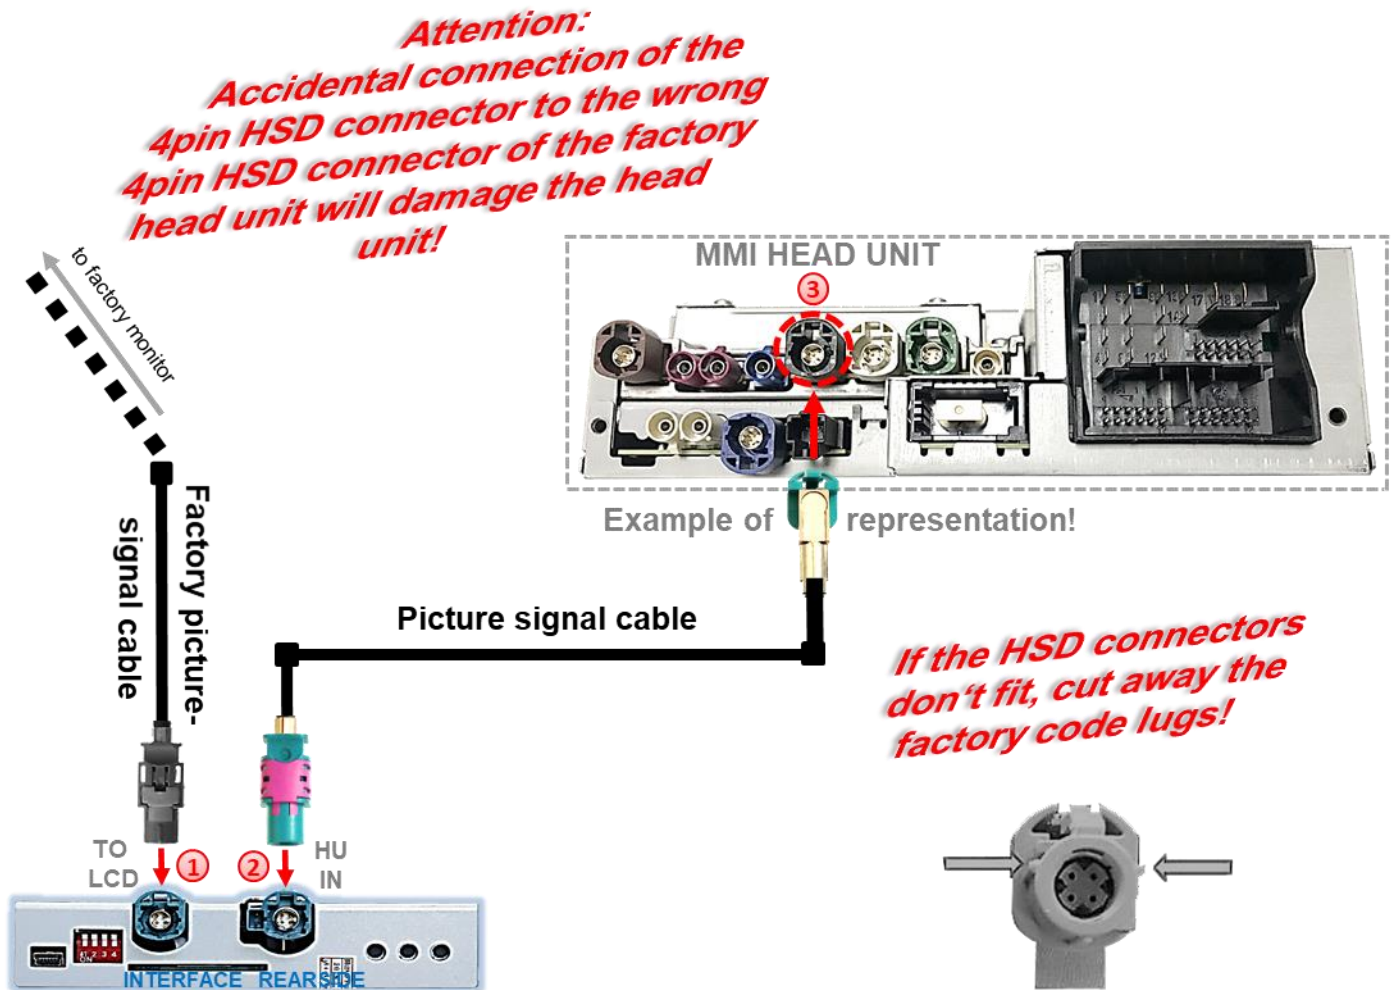

Remove the head unit.

Model	Location of the Head Unit
A6	at the top behind glove box
A8	behind the glove box
e-tron	centre console under the ventilation for the rear passengers*.

***Note:** In the e-tron, the following hidden screw (Torx) must be loosened at the rear of the centre console (one screw, the rest is inserted - ventilation doesn't have to be removed).

2.4.1. Connection – picture signal cable

- 1 Disconnect the factory picture signal cable's **black** female HSD connector at the rear-side of the head unit and connect it to the waterblue coloured male HSD connector „TO LCD“ of the video interface.
- 2 Connect the unangled female waterblue coloured HSD connector "To HU In-Interface" of the enclosed picture signal cable to the waterblue coloured HSD connector "HU IN" of the video Interface.
- 3 Connect the opposite angled waterblue coloured HSD connector "To HU" of the enclosed picture signal cable to the previously become free HSD plug of the head unit.

Note: Depending on the installation conditions, the enclosed picture signal cable may also be mounted upside down, concerning it's HSD connectors . However, it's connection must only be made at the head unit!

2.4.2. Connection - Quadlock – CAN

- ① Connect the 10pin power/CAN cable's female 10pin connector to the 10pin connector of the video interface.
- ② Disconnect the female Quadlock connector of the vehicle harness from the rear-side of the head-unit and connect the previously clipped out female 12pin connector to the grey coloured male 12pin connector of the PNP harness.
- ③ Clip in the grey coloured female 12pin connector of the PNP harness in the previously become free position of the female Quadlock connector.

After that, finish the Quadlock reconnection at the rear-side of the head-unit.

2.4.3. Connection - Power

- 1 Connect the single yellow wire of the 10pin power/CAN cable to +12V permanent and stabile power supply.
- 2 Connect the single black wire of the 10pin power/CAN cable to the vehicle's negative ground.

Check 1

Exceptionally, the CAN communication may not succeed in all vehicles! If, after connecting the PNP harness, no interface LED lightens up while the ignition is turned on, additionally the analog power supply needs to be done! (see following chapter)

Check 2

Exceptionally, the power supply to the video interfaces may not be interrupted after switching to the vehicle's sleep mode. If the interface LEDs continue to shine even in the vehicle's sleep mode, please contact the support!

2.4.4. Analogue power supply

- 1 If, after connecting the PNP harness, no interface LED lightens up while the ignition is turned on, the purple coloured wire **Manual ACC** of the 12pin interface cable has to be connected additionally to **ACC** or **S-contact terminal 86s +12V** (e.g. glove compartment illumination).

2.4.5. Special case: CAN bus connection for vehicles with CAN bus tail lights if the reverse gear signal is not recognised

In some vehicles (e.g. vehicles based on the MEB modular system, including the Audi Q4 e-tron), the reverse gear signal is not available at every point on the CAN bus, especially not at the rear of the factory head unit. If the vehicle also has CAN bus-controlled tail lights, the analogue connection described in the previous chapter is also not possible.

In this case, the grey and blue CAN wires of the 10-Pin power/CAN cable can be disconnected and the interface ends connected to the CAN bus at another point in the vehicle, e.g. at the BCM (Body Control Module).

Attention: The reverse gear signal is not recognised by the interface via the CAN bus in all vehicles. If this is the case in conjunction with CAN bus-controlled tail lights, the special case described below is also not a solution. In such a case, only an additional CAN bus interface from another manufacturer can be used!

The BCM (Body Control Module) is located on the driver's side on the left-hand black male connector above the pedals:

Chamber A see illustration:

- 1 Disconnect the 2 CAN bus wires (grey - pin 1, blue - pin 6) of the 10-Pin power/CAN cable approx. 4-5 cm behind the black male connector and insulate the ends to the PNP section for Quadlock.
- 2 Connect the interface-side blue CAN bus wire CAN-High of the 10-Pin power/CAN cable to CAN-High of male connector A of the BCM (Body Control Module, green - pin 16) of the vehicle.
- 3 Connect the interface-side grey CAN bus wire CAN-High of the 10-Pin power/CAN cable to CAN-High of male connector A of the BCM (Body Control Module, orange brown - pin 17) of the vehicle.

2.5. Power supply output

- ① The red power supply output **ACC/front cam out 12V (max 3A)** can be used to power an external source and has a different assignment depending on the position of dip switch 1 (of the black 8 dips):

Dip	Function
Dip 1 ON	+12V (max. 3A) when reverse gear is engaged incl. 10 seconds delay after reverse gear is disengaged and +12V by manual switching to front camera by keypad (short press)
Dip 1 OFF	+12V (max. 3A) ACC

2.6. Connection - video sources

It is possible to connect an after-market rear-view camera, an after-market front camera and two more video sources to the video-interface.

Before a final installation of the video sources, we recommend a test-run to ensure the compatibility of vehicle and interface. Due to changes in the production of the vehicle manufacturer there's always a possibility of incompatibility.

- ① Connect the video RCA of the Rear-view camera to the 12pin interface cable's female RCA connector „Reverse V4“.
- ② Connect the front camera's video RCA connector to the 12pin interface cable's female RCA connector „Front V3“.
- ③ Connect the video RCA of the AV source 1 and 2 to the 12pin interface cable's female RCA connector “Left (V1)” and “Right (V2)”.

2.6.1. Audio-insertion

This interface is only able to insert video signals into the factory infotainment. If an AV-source is connected, the audio insertion has to be done by the factory audio AUX input or an FM-modulator. The inserted video-signal can be activated simultaneously to each audio-mode of the factory infotainment. If 2 AV sources shall be connected to the infotainment, additional electronic is necessary to switch the audio signals.

2.6.2. After-market front camera

- ① The red power supply output **ACC/front cam out 12V (max 3A)** can be used to power a front camera. If Dip 1 is set to ON (black 8 dips), the power supply output gives +12V (max 3A) when reverse gear is engaged incl. 10 seconds delay after reverse gear is disengaged.

Note: In addition, a manual switch-over to the front camera input is possible via keypad (short press) from any image mode. The power supply output gives +12V then, as well (if Dip 1 is set to ON and the front camera input is selected).

Attention: A long press of the external keypad push button will switch the interface to the next source.

2.6.3. After-market rear-view camera

Some vehicles have a different reverse gear code on the CAN-bus which the video-interface is not compatible with. Therefore, there are two different ways of installation. If the video interface receives a signal of the reverse gear, the green wire “Reverse-OUT” of the 20pin cable should carry +12V while the reverse gear is engaged.

Automatic switching functions for reverse and front camera are not available on vehicles with CAN-bus controlled tail lights. In this case, an optional external CAN bus interface, such as CX-400/CX-401, is required.

Note: Do not forget to set video interface’s dip5 to ON before testing.

2.6.3.1. Case 1: Interface receives the reverse gear signal

If the interface delivers +12V on the green output wire of the 12pin interface cable while reverse gear is engaged, the video interface will automatically switch to the rear-view camera input “Camera IN” while the reverse gear is engaged.

- 1 Additionally, the +12V (max. 3A) power supply for the rear-view camera can be taken from the green wire of the 12pin interface cable.

2.6.3.2. Case 2: Interface does not receive the reverse gear signal

If the video interface does not deliver +12V on the green wire of the 12pin cable when reverse gear is engaged (not all vehicles are compatible), an external switching signal from the reverse gear light is required. As the reverse gear light's power supply isn't voltage-stable all the time, an ordinary open relay (e.g AC-RW-1230 with wiring AC-RS5) or filter (e.g. AC-PNF-RVC) is required. The diagram below shows the connection type of the relay.

- ① Disconnect the green cable's preconnected male- and female connectors of the 12pin interface cable and connect the green input cable "Reverse-IN" to the output connector (87) of the relay.

Note: Last but not lot least to avoid short circuits, the best solution should be, to crimp a male 4mm connector to the relay's output cable and connect it to the green cable's female 4mm connector. The output-cable "Reverse-OUT" remains disconnected as it's out of function.

- ② Connect the Reverse light's power-cable to coil (85) and the vehicle's ground to coil (86) of the relay.
- ③ Connect the output connector (87) of the relay to the rear-view camera's power-cable, like you did it to the green "Reverse-IN" cable before.
- ④ Connect stabile and permanent +12V to the relay's input connector (30).

2.7. Connection - video-interface and keypad

- 1 Connect the female 4pin connector of the keypad to the male 4pin connector of the 12pin interface cable.

Note: Even if switching through several video sources by the keypad mightn't be required, the invisible connection and availability is strongly recommended.

2.8. Picture settings and guide lines

The picture settings are adjustable by the 3 push-buttons at the rear-side of the video-interface. Press the MENU button to open the OSD settings menu or to switch to the next menu item. Press UP and DOWN to change the selected value. The buttons are placed inside in the housing to avoid accidental changes during or after the installation. Picture settings must be done separately for all video inputs while the corresponding input is selected and visible on the monitor.

Note: The OSD menu is only shown when a working video source is connected to the selected video-input of the interface.

The following settings are available:

Contrast	
Brightness	
Saturation	
Position H (horizontal)	= horizontal picture position
Position V (vertical)	= vertical picture position
Guide P	= guide-lines position

Note: If there is no communication between interface and the vehicle's CAN-bus (several vehicles aren't compatible), the optical PDC and the reverse gear guide-lines can't be shown during the vehicle's operation, even if they once appear after having switched the system to powerless!

3. Interface operation

3.1. By factory infotainment button

To switch sources

Left – Top corner
for 3 seconds

A long press in the touch display's left upper edge switches the interface's activated video sources.

If all inputs are activated by dip switch settings, the order is the following:

Factory video → Video IN 1 → Video IN 2 → factory video

Each press will switch to the next enabled input. Inputs which are not enabled will be skipped.

Switchover by vehicle buttons isn't possible in all vehicles. In some vehicles the external keypad has to be used.

3.2. By keypad

Alternatively or additionally to the factory infotainment buttons, the interface's external keypad can be used to switch the enabled inputs. Even if not needed, the keypad should always remain connected to the video interface for support purposes.

➤ Long press of keypad (2-3 seconds)

By long pressing the external keypad (2-3 seconds), the video interfaces switches the input from the factory video to the inserted video sources. Each long press will switch to the next enabled input. Inputs which are not enabled will be skipped.

Note: The interface switches after releasing the switch (after long pressure).

➤ Short press of keypad (only if DIP 1 is set to ON)

By short pressing the external keypad, the video interfaces witches from the factory video to the front camera input and back to factory video.

4. Specifications

BATT/ACC range	7V - 25V
Stand-by power drain	10mA
Power	300mA @12V
Video input	0.7V - 1V
Video input formats	NTSC
Temperature range	-40°C to +85°C
Dimensions video-box	116 x 25 x 103 mm (W x H x D)

5. FAQ – Trouble shooting Interface functions

For any troubles which may occur, check the following table for a solution before requesting support from your vendor.

Symptom	Reason	Possible solution
No picture/black picture (factory picture).	Not all connectors have been reconnected to factory head-unit or monitor after installation.	Connect missing connectors.
	No power on CAN-bus box (all LED CAN-bus box are off).	Check power supply of CAN-bus box. Check CAN-bus connection of CAN-bus box.
	CAN-bus box connected to CAN-bus in wrong place.	Refer to the manual where to connected to the CAN-bus. If not mentioned, try another place to connect to the CAN-bus.
	No power on video-interface (all LED video-interface are off).	Check whether CAN-bus box delivers +12V ACC on red wire output of 8pin to 6pin cable. If not cut wire and supply ACC +12V directly to video-interface.
No picture/black picture/white picture (inserted picture) but factory picture is OK.	No picture from video source.	Check on other monitor whether video source is OK.
	No video-source connected to the selected interface input.	Check settings dips 1 to 3 of video interface which inputs are activated and switch to corresponding input(s).
	LVDS cables plugged in wrong place.	Double-check whether order of LVDS cables is exactly connected according to manual. Plugging into head-unit does not work when the manual says to plug into monitor and vice versa.
Inserted picture totally wrong size or position.	Wrong monitor settings of video-interface.	Try different combinations of dips 7 and 8 of video-interface. Unplug 6pin power after each change.
Inserted picture double or 4 times on monitor.		
Inserted picture distorted, flickering or running vertically.	Video sources output set to AUTO or MULTI which causes a conflict with the interfaces auto detection.	Set video source output fixed to PAL or NTSC. It is best to set all video sources to the same standard.
	If error occurs only after source switching: Connected sources are not set to the same TV standard.	Set all video sources to the same standard.
	Some interfaces can only handle NTSC input.	Check manual whether there is a limitation to NTSC mentioned. If yes, set source fixed to NTSC output.
Inserted picture b/w.	Picture settings have not been adjusted.	Use the 3 buttons and the interface's OSD to adjust the picture settings for the corresponding video input.
Inserted picture qual. bad.		
Inserted picture size slightly wrong.		
Inserted picture position wrong.		
Camera input picture flickers.	Camera is being tested under fluorescent light which shines directly into the camera.	Test camera under natural light outside the garage.
Camera input picture is bluish.	Protection sticker not removed from camera lens.	Remove protection sticker from lens.

Symptom	Reason	Possible solution
Camera input picture black.	Camera power taken directly from reverse gear lamp.	Use relay or electronics to "clean" reverse gear lamp power. Alternatively, if CAN-bus box is compatible with the vehicle, camera power can be taken from green wire of 6pin to 8pin cable.
Camera input picture has distortion.		
Camera input picture settings cannot be adjusted.	Camera input picture settings can only be adjusted in AV2 mode.	Set dip 3 of video-interface to ON (if not input AV2 is not already activated) and connect the camera to AV2. Switch to AV2 and adjust settings. Reconnect camera to camera input and deactivate AV2 if not used for other source.
Graphics of a car in camera input picture.	Function PDC is ON in the interface OSD.	In compatible vehicles, the graphics will display the factory PDC distance. If not working or not wanted, set interface OSD menu item UI-CNTRL to ALLOFF.
Chinese signs in camera input picture	Function RET or ALL is ON (function for Asian market) in the interface OSD.	Set interface OSD menu item UI-CNTRL to ALLOFF or PDCON.
Not possible to switch video sources by OEM button.	CAN-bus interface does not support this function for vehicle.	Use external keypad or cut white wire of 6pin to 8pin cable and apply +12V impulses for AV-switching.
Not possible to switch video sources by external keypad.	Pressed too short.	For video source switching a longer press of about 2.5 seconds is required.
	SW-version of interface does not support external keypad.	Use OEM-button or cut white wire of 6pin to 8pin cable and apply +12V impulses for AV-switching.
Interface does not switch to camera input when reverse gear is engaged.	CAN-bus interface does not support this function for the vehicles.	Cut the green wire of the 6pin to 8pin cable and apply +12V constant from reverse gear-lamp signal. Use relay to "clean" R-gear lamp power.
Interface switches video-sources by itself.	CAN-bus interface compatibility to vehicle is limited.	Cut the grey wire of 6pin to 8pin and isolate both ends. If problem still occurs, additionally cut the white wire of 6pin to 8pin cable and isolate both ends.

6. Technical Support

Please note that direct technical support is only available for products purchased directly from NavLinkz GmbH. For products bought from other sources, contact your vendor for technical support.
